GLOBAL FUEL PRICES AND TAXATION TRENDS

A Comprehensive Global Analysis

Project Type	Data analysis, visualization and web development
Technologies	Tableau, Python, Flask, HTML and CSS
Website	Flask website with embedded Tableau dashboard

Project Documentation

1. Project Overview

This project explores global fuel prices and taxation trends across countries and regions over time. The analysis is presented through Tableau visualizations, a Tableau dashboard and a Tableau Story. A Flask-based website brings the dashboard and Story together in one place.

2. Project Objectives

• Compare gasoline and diesel prices across countries.
• Explore fuel-price changes over different years.
• Compare fuel prices across regions.
• Examine the role of taxes in pump prices.
• Explore inflation-adjusted fuel prices where available.
• Present the analysis through an accessible website.

3. Tools and Technologies

Tool	Purpose
Python	Runs the application logic.
Flask	Serves the website and renders the HTML page.
HTML	Structures website content.
CSS	Styles the layout and visual presentation.
Tableau	Creates visualizations, the dashboard and Story.
CSV files	Store the data used for analysis.

4. Dataset and Data Preparation

The project uses CSV data containing country-wise and region-wise fuel-price information. Depending on available records, fields include year, country, region, gasoline price, diesel price, tax percentage of pump price and inflation-adjusted price.

5. Visualizations and Dashboard

The Tableau dashboard brings the project's charts together for comparison. Intended analyses include country-wise gasoline prices, year-wise fuel-price trends, regional comparisons, taxation comparisons and inflation-adjusted prices. Keep only the chart types that are actually present in the final dashboard.

6. Tableau Story

The Tableau Story presents the analysis as a sequence of story points. It guides viewers through country comparisons, historical trends, regional differences and taxation patterns.

7. Flask Website

The website uses Flask to serve the homepage. The HTML template contains the project introduction and embedded Tableau views, while CSS provides the visual design. The published Tableau dashboard and Story are embedded so visitors can explore the analysis from the website.

Project structure

Global Fuel Project:-

- app.py
- README.md (optional supporting guide)
- templates/index.html
- static/style.css
- dataset CSV files (actual location may differ)

8. How to Run the Website

1. Install Python if needed.
2. Open a terminal in the project folder.
3. Install Flask: **py -m pip install flask**
4. Start the application: **py app.py**
5. Open http://127.0.0.1:5000/ in a browser.

The address above is for local testing on the computer running Flask; it is not a public website URL.

9. Published Tableau Links

Tableau Dashboard:

https://public.tableau.com/javascripts/api/tableau.embedding.3.latest.min.js

Tableau Story:
https://public.tableau.com/views/GlobalFuelPricesandTaxationTrends_17930429298140/Story1?:language=en-GB&:sid=&:redirect=auth&:display_count=n&:origin=viz_share_link

10. Testing and Validation

Before submission, verify that the Flask website opens, both embedded views load, Story points navigate correctly, available filters behave as expected, and the page can be viewed on desktop and smaller screens. Record any known limitations honestly.

11. Conclusion

This project combines data visualization and web development to present global fuel-price and taxation trends in an accessible format. The Tableau dashboard supports comparisons across countries, regions and years, while the Story provides a guided sequence of views. The Flask website brings these components together.

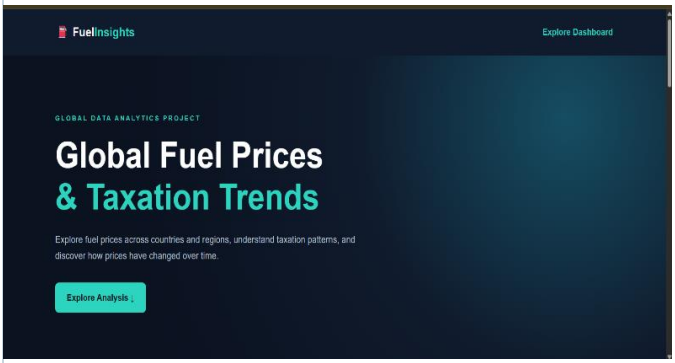

12. Future Scope

Possible improvements include adding more recent data, expanding country and regional comparisons, adding further interactive filters, improving accessibility and deploying the website to public hosting.
